

Stack Sections

Framer plugin, step 1 of your brief

- Three sections in a panel. Click one, it goes on the canvas.
- It comes in as normal editable layers, nothing locked.
- Runs in a brand new Framer project, no setup beyond npm run dev.

Repo

github.com/kafle1/stack-framer-plugin

Run it

```
npm install  
npm run dev
```

Needs Node 20.19 or newer, npm stops with a clear message on anything older.

Built with

- React + TypeScript + Vite
- @framer/plugin v4
- No backend, sections are a plain array

Opening it in Framer

Two menu items, both under Plugins

In order

- npm run dev in the repo
- Plugins, Show Developer Tools
- Plugins, Open Development Plugin
- panel opens top right

Developer Tools is per project,
so flip it on once in each
project you test in.

The panel

Three cards, hardcoded for step 1

What you get

- one click, one insert
- cards lock while adding,
- so a double click can't
- drop two copies
- a failed insert says so

Click a card

Hero, straight into the page

Three confirmations

- the section in the page
- a Framer toast
- the panel status line

Nothing to configure, nothing to select first.

Three clicks, one page

Sections stack, they don't scatter

How it works

- first insert switches the
- page frame to a vertical
- stack
- every section after that
- lands under the last one,
- full width

No dragging, no lining things up by hand.

They are real layers

Not a locked instance, the whole point of detaching

Why it matters

- text, colour, spacing, all
- editable like anything
- they drew themselves
- nothing is locked off

Trade off: a detached copy never picks up changes you make to your source section later. Worth deciding before step 2.

Your open questions

Answered from the actual run, not guessed

Detached or linked for someone who remixed a template?

Detached. It lands as normal layers, they can edit text, colour, spacing, nothing is locked. The catch: those copies never pick up changes you make to the source section later.

What happens with nothing selected on the canvas?

Nothing, selection doesn't matter any more. The section goes into the page frame either way and stacks under whatever is already there.

Any limit on inserts per session?

None I could hit. A dozen inserts in one session, no throttling, no error.

One thing your doc got wrong

The doc says framer-plugin. Setting up a plugin today installs @framer/plugin v4 and framer-plugin sits at 3.10.3, so it looks like the old package. I went with v4.

Something to know about detaching

It only works on components drawn in Framer. A code component throws "not a visual component". Your sections are drawn in Framer, so they detach.

What is not in here

Step 1 only, on purpose

- Search, category chips, thumbnails
- Catalogue read from a JSON file instead of the array
- Singleton guard, loading and empty states
- The Setup panel, PRO cards, marketplace submission

To swap in your sections

`src/sections.ts` holds three objects. Replace the three url fields with your component URLs (Assets, right click the component, Copy URL). Nothing else changes.

Next

Send the three component URLs and I will swap them in. Step 2 is the full Sections panel against your ~15 sections, priced separately.
