

Stack Sections

Framer plugin, step 1 of your brief

- Three sections in a panel. Click one, it goes on the canvas.
- A toast and a line in the panel confirm every insert.
- Runs in a fresh Framer project, no setup beyond npm run dev.

Repo

github.com/kafle1/stack-framer-plugin

Run it

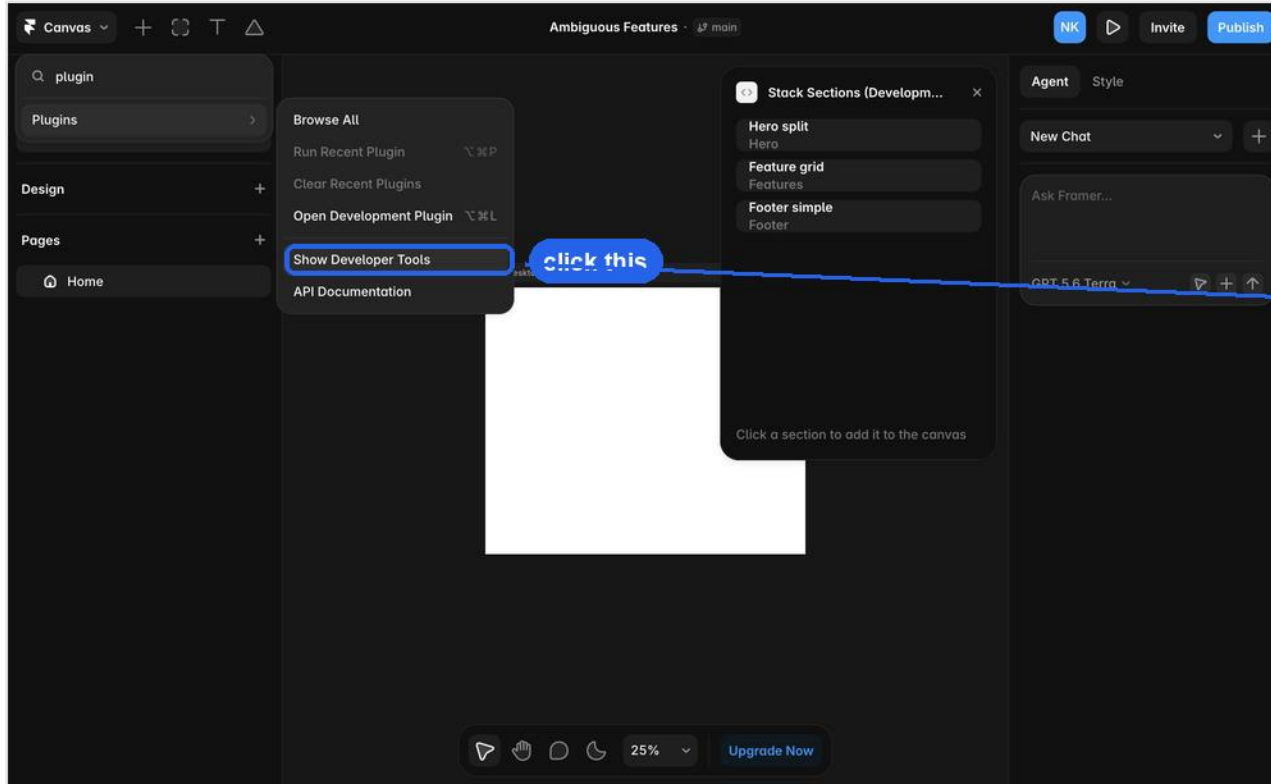

```
npm install  
npm run dev
```

Built with

- React + TypeScript + Vite
- @framer/plugin v4
- No backend, sections are a plain array

Opening it in Framer

Menu top left, search plugin, then Show Developer Tools

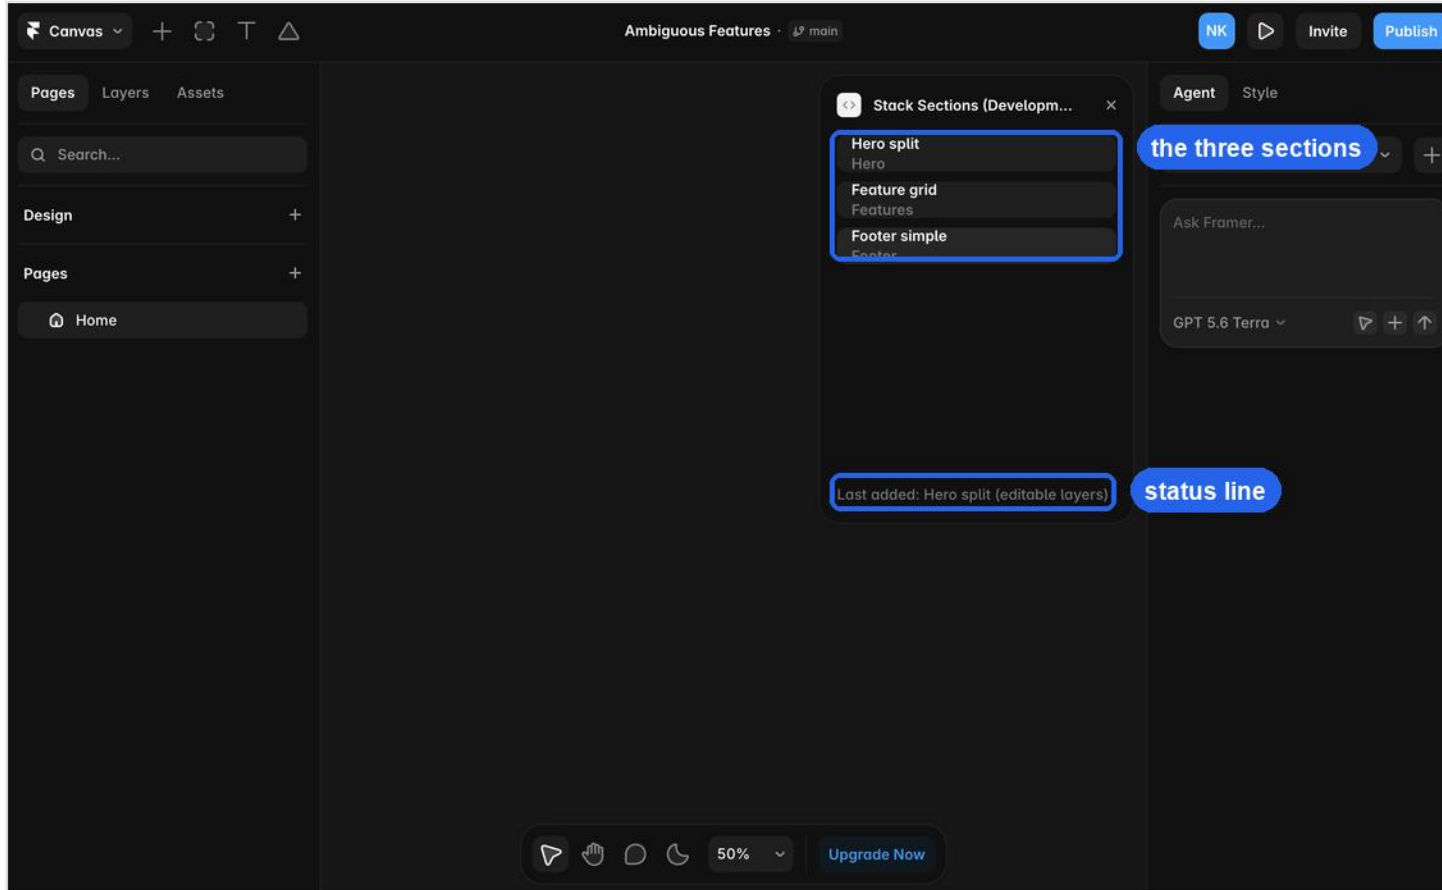

Three steps

- npm run dev in the repo
- Framer menu, top left
- type plugin, open Plugins
- click Show Developer Tools

The panel opens top right and stays there while you work.

The panel

Three cards, hardcoded for now, same shape as your catalogue entry

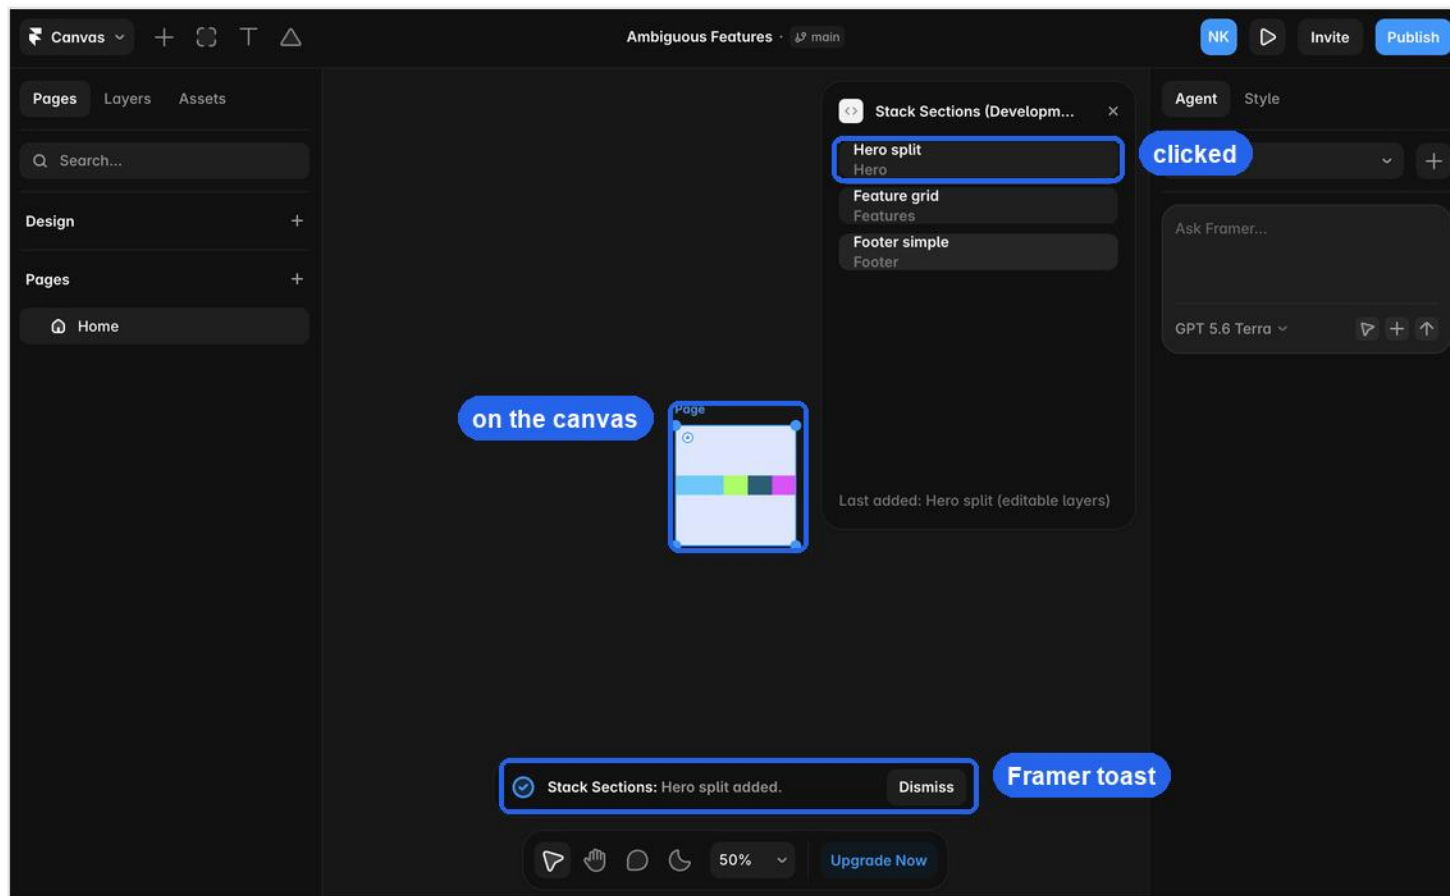

What each card is

- name and category
- one click = one insert
- goes disabled while adding,
- so a double click can't
- drop two copies

Click a card

Hero split, dropped on the canvas as editable layers

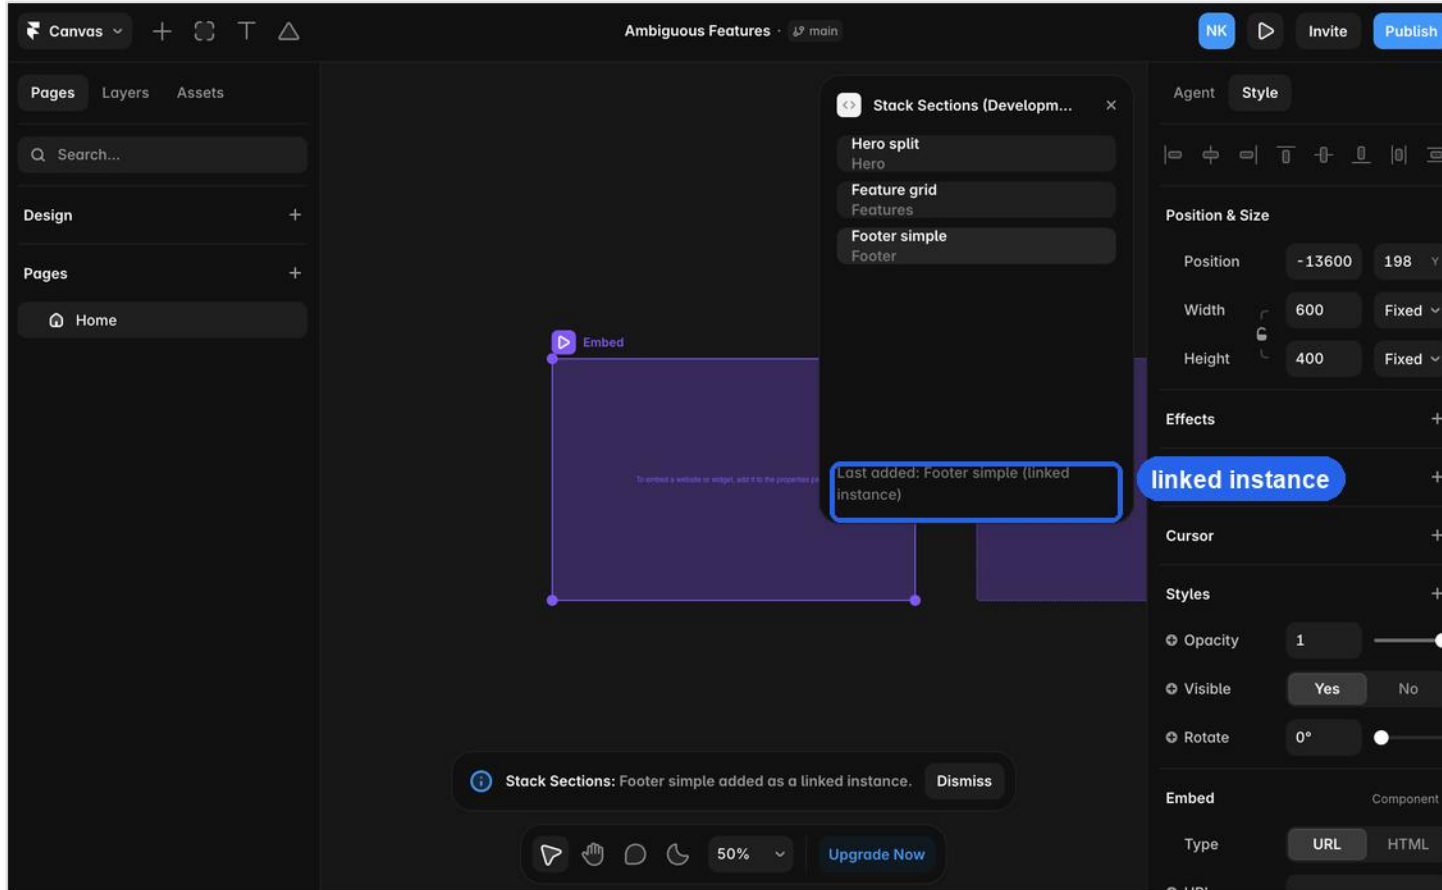

Three confirmations

- the section on the canvas
- Framer's own toast
- 'Last added' in the panel

A failed insert shows the real error in the toast instead of doing nothing.

Detached or linked

The one thing worth deciding before step 2

What happened

- detach only works on
- components drawn in Framer
- a code component throws
- 'not a visual component'
- so it falls back to a
- linked instance instead

Your sections are drawn in Framer, so all three will detach. The placeholders here are code components, that is why two come in linked.

Your open questions

Answered from the actual run, not guessed

Detached or linked for someone who remixed a template?

Detached. It lands as normal layers, they can edit text, colour, spacing, nothing is locked.
The catch: those copies never pick up changes you make to the source section later.
If the library keeps growing, that is a real decision, not a detail.

What happens with nothing selected on the canvas?

It still inserts. It just lands beside the frame at a negative X, not inside the page.
Nothing errors. If you want it to land in the page, step 2 has to target the frame.

Any limit on inserts per session?

None I could hit. A dozen inserts in one session, no throttling, no error.

Package name in your doc

The doc says framer-plugin. Setting up a plugin today installs @framer/plugin v4 and framer-plugin sits at 3.10.3, so it looks like the old one. I went with v4.

What is not in here

Step 1 only, on purpose

- Search, category chips, thumbnails
- Catalogue read from a JSON file instead of the array
- Singleton guard, loading and empty states
- The Setup panel, PRO cards, marketplace submission

To swap in your sections

src/sections.ts holds three objects. Replace the three url fields with your component URLs (Assets, right click a code component, Copy URL). Nothing else changes.

Next

Send the three component URLs and I will swap them in. Step 2 is the full Sections panel against your ~15 sections, priced separately.
